# Limit Theorems on Fuzzy Markov Chains 

J.Earnest Lazarus Piriya kumar, V.Sreevinotha,<br>Department Of Mathematics, Tranquebar Bishop Manickam Lutheran College, Porayar - 609307, South India.

#### Abstract

In this paper we attempt to show the limit theorems for fuzzy Markov chains. Using stationary distribution we establish conditions for the existence of a Fuzzy Markov chain.

Key Words: Fuzzy Markov chain, Fuzzy Transition Probability and Fuzzy functions.

## I. INTRODUCTION

Markov chains are one of the most important tools to model random phenomena evolving in time. A weak point of the most widely used model is that transition probabilities have to be constant and precisely known. An attempt to relax this restriction was proposed By Skulj[8] where the assumption of precisely known initial and transition probabilities is relaxed so that probability intervals are used instead of precise probabilities. Their model is based on the assumption that constant classical probabilities rule the process but only approximations are known instead of precise values.

The theory of Markov systems provide an effective and powerful tool for describing State of the system. Since numerous applied probability models can be adopted in their framework. Roughly speaking the Markov property requires that knowledge of the current state of the system provides all the information relevant to predicting its future. There have been a few other papers published on fuzzy Markov Chains[2,3,5,6].
The organization of the paper is as detailed below Section 2 is devoted to fuzzy functions where Continuous we have defined the fuzzy functions. Section 3 is addressing the notions of limit theorems on Fuzzy Markov chains. In Section 4 we are discussing about stationary distribution of a fuzzy Markov chain. We establish the conditions for the existence of a Markov chain.

## II. FUZZY FUNCTIONS

Set valued functions and their calculus were found useful in of the problem in economics [1] and control theory [4]. From a probabilistic point of view random sets have a rather well developed theory [7].
$M$ is a set, a fuzzy subset of $M$ is a function $u: M \rightarrow[0,1]$. The set of all fuzzy subsets of $M, F(M)$ is a completely distribution lattice which includes the ordinary subsets of M . For any fuzzy subset $\mathrm{u}: \mathrm{M} \rightarrow[0,1]$ denote by $\mathrm{L}_{\alpha}(\mathrm{u})=\{\mathrm{m} \in \mathrm{M} ; \mathrm{u}(\mathrm{m}) \geq \alpha\} \quad \alpha \in[0,1]$ is the $\alpha$-level set of u .
If $M$ is a vector space a fuzzy subset $u \in F(M)$ is called a fuzzy Convex subset if
$u\left(\lambda m_{1}+(1-\lambda) m_{2}\right) \geq \min \left[u\left(m_{1}\right), u\left(m_{2}\right)\right]$ for every $m_{1,} m_{2} \in M, \lambda \in[0,1]$.
If X is a reflexive Banach space, in order to extend the Hausdorff distance we shall consider the subset $\mathrm{F}_{0}(\mathrm{X})$ of $F(X)$ containing all fuzzy sets $u: X \rightarrow[0,1]$ with properties
i) $u$ is upper semi continuous.
ii) $u$ is fuzzy convex.
iii) $L_{\alpha}(u)$ is compact for every $\alpha \neq 0$.

If $u, v \in F_{0}(X)$ define the distance between $u$ and $v$ by $d(u, v)={ }_{\alpha>0}^{\sup } d_{H}\left(L_{\alpha}(u), L_{\alpha}(v)\right)$ Where $\mathrm{d}_{\mathrm{H}}$ denotes the Hausdorff distance.
Let X be a normed space, and u be an open subset of X . Let y be a reflexive Banach space. By a fuzzy function we mean a function $F: u \rightarrow F_{0}(y)$ such a function associates to each point $x \in U$ a fuzzy subset $F(x)$ of $y$ clearly such fuzzy functions generalizes set valued function $u \rightarrow Q(y)$.

## III. LIMIT THEOREMS

LEMMA: 3.1
If the fuzzy states Fs is recurrent and $\mathrm{Fs} \rightarrow \mathrm{Fr}$, then Fr is recurrent and $\mathrm{f}_{\mathrm{FsFr}}=\mathrm{f}_{\mathrm{FrFs}}=1$.
Proof:
Assume $\mathrm{Fs} \neq \mathrm{Fr}$ for otherwise there is nothing to prove.
Since $\mathrm{f}_{\mathrm{FsFr}}>0$ there exists no such that $P_{F S F r}{ }^{\left(n_{0}\right)}>0$ and
$P_{F S F r}{ }^{(m)}=0$ for $0<\mathrm{m}<\mathrm{n}_{0}$.
Since $P_{F s F r}{ }^{\left(n_{0}\right)}>0$ we can find states $\mathrm{F}_{1 \mathrm{i}} \mathrm{F}_{\mathrm{i} 2} \ldots \ldots . \mathrm{F}_{\mathrm{in} 0-1}$ such that
$P_{F s F i 1} \ldots \ldots . P_{F s F i n_{0}-1}>0$ and none of the states $F_{i 1} F_{i 2} \ldots \ldots F_{i n_{0}-1}$ equal Fs or Fr , for if one of them did equal Fs or Fr it would be possible to go from Fs to Fr with positive probability in fewer then $\mathrm{n}_{0}$ steps in contradiction to (3.1)

Suppose $\mathrm{f}_{\mathrm{FrFs}}<1$. Then a Markov chain staring from I has positive probability $1-\mathrm{f}_{\mathrm{FrFs}}$ of never hitting Fs and that implies it has positive probability $P_{F r F s_{1}} \ldots \ldots . P_{F r n_{0}-1 F r}\left(1-f_{F r F s}\right)$ of visiting the states $F_{r 1} F_{r 2} \ldots \ldots F_{r n_{0}-1}$, Fr successively in the first $\mathrm{n}_{0}$ steps and never return to Fs after $\mathrm{n}_{0}$ steps. But if this happens then the fuzzy Markov chain never return to Fs at any time $\mathrm{n}>1$ and that contradict the fact that Fs is recurrent. So $\mathrm{f}_{\mathrm{FrFs}}=1$. Since $\mathrm{f}_{\mathrm{FrFs}}=1$ there exists $\mathrm{n}_{1}$ such that $P_{\text {FrFs }}{ }^{\left(n_{1}\right)}>0$.
Now

$$
P_{F r F r}{ }^{\left(n_{1}+n+n_{2}\right)} \geq P_{F r F s}{ }^{\left(n_{1}\right)} P_{F s F s}{ }^{(n)} P_{F s F r}{ }^{\left(n_{0}\right)}
$$

and
hence

$$
\begin{aligned}
& \sum_{n=1}^{\infty} P_{F r F r}{ }^{(n)} \geq \sum_{n=1}^{\infty} P_{F r F r}\left(n_{1}+n+n_{2}\right) \\
\geq & P_{F r F s}{ }^{\left(n_{1}\right)} P_{F s F r}{ }^{\left(n_{0}\right)} \sum_{n=1}^{\infty} P_{F s F s}{ }^{(n)}=\infty
\end{aligned}
$$

Hence Fr is recurrent.
Since Fr is recurrent and $\mathrm{Fr} \rightarrow \mathrm{Fs}\left(\mathrm{f}_{\mathrm{FrFs}}=1\right)$ from the first part of the proof it follows that $\mathrm{f}_{\mathrm{FsFr}}=1$.

## THEOREM: 3.1

$$
P_{F r F s}{ }^{(n)}=\sum_{m=1}^{\infty} f_{\text {FrFs }}{ }^{(m)} P_{F s F s}{ }^{(n-m)} \text { for all } m=1,2, \ldots . n
$$

Proof:

$$
P_{F r F s}^{(n)}=\bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}{ }^{(n)}\right)_{\alpha}
$$

$=\bigcup_{\alpha \in(0,1]} \alpha\left(P\left[X_{n}=F_{s} \mid X_{0}=F_{r}\right]\right)_{\alpha}$
$=\bigcup_{\alpha \in(0,1]}^{\alpha \in(0,1]} \alpha P\left[X_{n}=\left(F_{s}\right)_{\alpha} \mid X_{0}=\left(F_{r}\right)_{\alpha}\right]$
$=\sum_{m=1}^{\infty} \bigcup_{\alpha \in(0,1]} \alpha P\left[X_{n}=\left(F_{s}\right)_{\alpha} X_{m}=\left(F_{s}\right)_{\alpha} X_{m-1} \neq\left(F_{s}\right)_{\alpha} \ldots \ldots X_{1} \neq\left(F_{s}\right)_{\alpha} \mid X_{0}=\left(F_{r}\right)_{\alpha}\right]$
We take $X_{m}=\left(F_{s}\right)_{\alpha}=A$

$$
\begin{gathered}
X_{m}=\left(F_{s}\right)_{\alpha} X_{m-1} \neq\left(F_{s}\right)_{\alpha} \ldots \ldots X_{1} \neq\left(F_{s}\right)_{\alpha}=B_{m} \text { and } X_{0}=\left(F_{r}\right)_{\alpha}=c \\
P_{F r F s}{ }^{(n)}=\sum_{m=1}^{n} P\left[A B_{m} \mid c\right]
\end{gathered}
$$

Where $\mathrm{B}_{\mathrm{m}}$ are disjoint and $\mathrm{U}_{m-1}^{n} B_{m} \supset A$
Hence

$$
\begin{gathered}
P_{F r F s}^{(n)}=\sum_{m=1}^{n} \frac{P\left[A B_{m}\right] P\left[B_{m} c\right]}{P[c] P\left[A B_{m} c\right]} \\
=\sum_{m=1}^{n} P\left[A \mid B_{m} c\right] P\left[B_{m} \mid c\right] \\
=\sum_{m=1}^{\infty} \bigcup_{\alpha \in(0,1]} \alpha P\left[X_{n}=\left(F_{s}\right)_{\alpha} \mid X_{m}=\left(F_{s}\right)_{\alpha} X_{m-1} \neq\left(F_{s}\right)_{\alpha} \ldots \ldots X_{1} \neq\left(F_{s}\right)_{\alpha}, X_{0}=\left(F_{r}\right)_{\alpha}\right] \\
\bigcup_{\alpha \in(0,1]} \alpha P\left[X_{n}=\left(F_{s}\right)_{\alpha} X_{m}=\left(F_{s}\right)_{\alpha} X_{m-1} \neq\left(F_{s}\right)_{\alpha} \ldots \ldots X_{1} \neq\left(F_{s}\right)_{\alpha} \mid X_{0}=\left(F_{r}\right)_{\alpha}\right] \\
=\sum_{m=1}^{\infty} \bigcup_{\alpha \in(0,1]} \alpha P\left[X_{n}=\left(F_{s}\right)_{\alpha} \mid X_{m}=\left(F_{s}\right)_{\alpha}\right] f_{F r F s}^{(m)}
\end{gathered}
$$

$$
\begin{gathered}
=\sum_{m=1}^{\infty} \bigcup_{\alpha \in(0,1]} \alpha P_{F s F r}^{(n-m)} f_{F r F s}^{(m)} \\
\quad=\sum_{m=1}^{\infty} P_{F s F r}{ }^{(n-m)} f_{F r F s}^{(m)}
\end{gathered}
$$

THEOREM: 3.2 (LIMIT THEOREM)
Let Fs be a fixed state in a fuzzy Markov chain and Fr be an arbitrary state.
Then as $\mathrm{n} \rightarrow \infty$.
(i) If Fs is transient then $P_{F s F r}{ }^{(n)} \rightarrow 0$ as $\mathrm{n} \rightarrow \infty$.
(ii) If Fs is null recurrent then $P_{F s F r}{ }^{(n)} \rightarrow 0$
(iii) If Fs is positive recurrent and the Markov chain is aperiodic then $P_{F s F r}^{(n)} \rightarrow \frac{f_{F s F r}}{\mu_{\mathrm{Fs}}}$ Proof:
By theorem 3.1

$$
\begin{gathered}
P_{F r F s}{ }^{(n)}=\bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}{ }^{(n)}\right)_{\alpha} \\
=\sum_{m=1}^{n} \bigcup_{\alpha \in(0,1]} \alpha\left(f_{F r F s}{ }^{(m)}\right)_{\alpha}\left(P_{F s F s}{ }^{(n-m)}\right)_{\alpha} \\
=\sum_{m=1}^{n^{\prime}} \bigcup_{\alpha \in(0,1]} \alpha\left(f_{F r F s}{ }^{(m)}\right)_{\alpha}\left(P_{F s F s}{ }^{(n-m)}\right)_{\alpha}+\sum_{m=n^{\prime}+1}^{n} \bigcup_{\alpha \in(0,1]} \alpha\left(f_{F r F s}{ }^{(m)}\right)_{\alpha}\left(P_{F s F s}{ }^{(n-m)}\right)_{\alpha}
\end{gathered}
$$

Where $\mathrm{n}<\mathrm{n},<\mathrm{n}$; $(\mathrm{n} \geq 1)$
For $\in>0$ take $n$ ' and $n$ so large that

$$
\begin{equation*}
\sum_{m=n^{\prime}+1}^{n} \bigcup_{\alpha \in(0,1]} \alpha\left(f_{F r F s}^{(m)}\right)_{\alpha}<\epsilon \tag{3.3}
\end{equation*}
$$

When Fs is transient or null recurrent take n so large that

$$
\bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}^{(n-m)}\right)_{\alpha}<\in \text { for all } 0 \leq m<n^{\prime}<n
$$

By (3.2) and(3.3) we have

$$
\begin{align*}
0 \leq \bigcup_{\alpha \in(0,1]} \alpha & \left(P_{F r F s}{ }^{(n-m)}\right)_{\alpha}-\sum_{m=n^{\prime}+1}^{n} \bigcup_{\alpha \in(0,1]} \alpha\left(f_{F r F s}{ }^{(m)}\right)_{\alpha}\left(P_{F s F s}^{(n-m)}\right)_{\alpha} \\
& =\sum_{m=n^{\prime}+1}^{n} \bigcup_{\alpha \in(0,1]} \alpha\left(f_{F r F s}{ }^{(m)}\right)_{\alpha}\left(P_{F s F s}{ }^{(n-m)}\right)_{\alpha} \\
& \leq \sum_{m=n^{\prime}+1}^{n} \alpha\left(f_{F r F s}{ }^{(m)}\right)_{\alpha}<\epsilon \tag{3.4}
\end{align*}
$$

$0 \leq \lim _{n \rightarrow \infty} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}{ }^{(n)}\right)_{\alpha}$
$\leq \in+\in \sum_{m=n^{\prime}+1}^{n} \bigcup_{\alpha \in(0,1]} \alpha\left(f_{\text {FrFs }}{ }^{(m)}\right)_{\alpha} \quad$ from
$\leq \epsilon+\epsilon$
$=2 \in$ for all $\in>0$
Therefore $U_{\alpha \in(0,1]} \alpha\left(P_{\text {FrFs }}{ }^{(n)}\right)_{\alpha} \rightarrow 0$ as $n \rightarrow \infty$
(iii)Give that, the fuzzy state Fs is positive recurrent and the fuzzy Markov chain is aperiodic.

Take $n \rightarrow \infty$ and $n$ ' fixed.
Then
$0 \leq \lim _{n \rightarrow \infty} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}^{(n)}\right)_{\alpha}-\lim _{n \rightarrow \infty} \sum_{m=1}^{n^{\prime}} \bigcup_{\alpha \in(0,1]} \alpha\left(f_{F r F s}^{(n)}\right)_{\alpha}\left(P_{F s F s}^{(n-m)}\right)_{\alpha}$
<E By (3.4)
$=\lim _{n \rightarrow \infty} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}{ }^{(n)}\right)_{\alpha}-\sum_{m=1}^{n^{\prime}} \bigcup_{\alpha \in(0,1]} \alpha\left(f_{F r F s}{ }^{(n)}\right)_{\alpha} \frac{1}{\mu_{F s}}$
$=\lim _{n \rightarrow \infty} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}{ }^{(n)}\right)_{\alpha}-\frac{1}{\mu_{F s}} \sum_{m=1}^{n^{\prime}} \bigcup_{\alpha \in(0,1]} \alpha\left(f_{F r F s}{ }^{(n)}\right)_{\alpha}$
<E
Take $n^{\prime} \rightarrow \infty$
$0 \leq \lim _{n \rightarrow \infty} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}{ }^{(n)}\right)_{\alpha}-\frac{1}{\mu_{F s}} \sum_{m=1}^{n^{\prime}} \bigcup_{\alpha \in(0,1]} \alpha\left(f_{F r F s}\right)_{\alpha}$
$\bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}{ }^{(n)}\right)_{\alpha} \rightarrow \frac{\mathrm{U}_{\alpha \in(0,1]} \alpha\left(f_{F r F s}\right)_{\alpha}}{\mu_{F s}}$
(ie) $\quad\left(P_{F r F s}{ }^{(n)}\right)_{\alpha} \rightarrow \frac{\left(f_{F r F s}\right)_{\alpha}}{\mu_{F s}}$

## IV. STATIONARY DISTRIBUTION

## DEFINITION: 4.1

A probability distribution is $\left\{\mathrm{V}_{\mathrm{Fs}}\right\}$ with $V_{F s} \geq 0 \quad \sum_{F S} V_{F s}=1$ is called a stationary distribution for a Markov chain with transition matrix $\mathrm{P}_{\mathrm{FrFs}}$ if
$V_{F s}=\sum_{F r} V_{F r} P_{F r F s}$
$=\sum_{F r} V_{F r} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}\right)_{\alpha}$
$=\sum_{F r} \sum_{F k} V_{F k} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F k F r}\right)_{\alpha}\left(P_{F r F s}\right)_{\alpha}$
$=\sum_{F k} V_{F k} \sum_{F r} \bigcup_{\alpha \in(0,1]}^{\alpha \in(0,1]} \alpha\left(P_{F k F r}\right)_{\alpha}\left(P_{F r F s}\right)_{\alpha}$
$=\sum_{F k}^{F k} V_{F k} \bigcup_{\alpha \in(0,1]}^{F r} \alpha\left(P_{F k F s}{ }^{(2)}\right)_{\alpha}$
$=\sum_{F k} V_{F k} \cup_{\alpha \in(0,1]} \alpha\left(P_{F k F s}{ }^{(n)}\right)_{\alpha}$
$=\sum_{F k} V_{F k} P_{F k F s}(n)$
Suppose a stationary distribution
$\pi=\left(\pi_{1}, \pi_{2}, \ldots \ldots\right)$ exists. Also suppose
$\lim _{n \rightarrow \infty} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}{ }^{(n)}\right)_{\alpha}=\pi_{F s} \geq 0$ for all $F r \geq 1$.
Then $\pi$ is called the steady state distribution of the Markov chain with Transition matrix $\left(\mathrm{P}_{\mathrm{FrFs}}\right)$.

## THEOREM 4.1

Let a Fuzzy Markov chain is irreducible, aperiodic and positive. Then
(i) $\quad \lim _{n \rightarrow \infty} P_{F r F s}{ }^{(n)}=\pi_{F s}$
(ii) $\quad \pi_{F S}>0 \sum_{F s} \pi_{F s}=1$
(iii) $\quad \pi_{F s}=\sum_{F s \in s} \pi_{F k} P_{F k F s}$

More over (ii) and (iii) determine $\left\{\pi_{F s}, F s \in s\right\}$ Completely.
Proof:
(i) The Proof of (i) follows from theorem 2.2 and the lemma.
(ii) $\quad \pi_{F s}=\frac{1}{\mu_{F s}}>0$

Suppose $S_{M}$ is a subset of the state space $S$ with exactly $M$ states.
Now,
$\sum_{F s \in S_{M}}^{N o w,} P_{F r F s}{ }^{(n)}$
$=\sum_{F s \in S_{M}} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}{ }^{(n)}\right)_{\alpha}$
$\leq \sum_{F s \in S} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}{ }^{(n)}\right)_{\alpha}$
$=1$
Let $\mathrm{n} \rightarrow \infty$ then
$\sum_{F s \in S_{M}} \pi_{F s} \leq 1$
Then taking limit $\mathrm{M} \rightarrow \infty$
$\sum_{F s \in S_{M}} \pi_{F s} \leq 1$
Then taking limit
$\sum_{F s \in S_{M}} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F k}{ }^{(n)}\right)_{\alpha}\left(P_{F k F s}\right)_{\alpha}$
$\leq \sum_{F s \in S_{M}} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F k}^{(n)}\right)_{\alpha} P_{F k F s}$
$=U_{\alpha \in(0,1]} \alpha\left(P_{\text {FrFs }}{ }^{(n+1)}\right)_{\alpha}$
Let $\mathrm{n} \rightarrow \infty$ then
$\lim _{n \rightarrow \infty} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F r F s}{ }^{(n+1)}\right)_{\alpha}$
$=\sum_{F s \in S_{M}}^{\alpha \in(0,1]} \pi_{F k} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F k F s}\right)_{\alpha}$
$\leq \pi_{F s}$
Then letting $\mathrm{M} \rightarrow \infty$ we get
$\sum_{F s \in S_{M}} \pi_{F k} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F k F s}\right)_{\alpha}$
$\sum_{F s \in S} \pi_{F s} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F s F r}{ }^{(2)}\right)_{\alpha}$
$=\sum_{F s \in S} \pi_{F s} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F s F k}\right)_{\alpha}\left(P_{F k F r}\right)_{\alpha}$
$=\bigcup_{\alpha \in(0,1]} \sum_{F s \in S}^{\alpha \in(0,1]} \pi_{F s} \alpha\left(P_{F s F k}\right)_{\alpha}\left(P_{F k F r}\right)_{\alpha}$
$=\bigcup_{\alpha \in(0,1]} \sum_{F s \in S}\left(\sum_{F s \in S} \pi_{F s} \alpha\left(P_{F s F k}\right)_{\alpha}\right)\left(P_{F k F r}\right)_{\alpha}$
$\leq \bigcup_{\alpha \in(0,1]} \sum_{F s \in S} \pi_{k} \alpha\left(P_{F k F r}\right)_{\alpha}$
$=\sum_{F s \in S}^{\alpha \in(0,1] ~} \pi_{F k} P_{F k F r}$
$\leq \pi_{F r}$
By induction
$\sum_{F s \in S} \pi_{F s} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F s F r}{ }^{(n)}\right)_{\alpha} \leq \pi_{F r}$ for all $n \geq 1 ; F s \in S$
Now
$\pi_{F k}=\pi_{F k}\left(\sum_{j \in S} P_{F k F s}{ }^{(n)}\right)$

$$
\left(\sum_{j \in S} P_{F k F s}{ }^{(n)}=1\right)
$$

$$
\begin{aligned}
\sum_{F k \in S} \pi_{F k} & =\sum_{F k \in S} \sum_{F s \in S} \bigcup_{\alpha \in(0,1]} \alpha \pi_{k}\left(P_{F k F S}{ }^{(n)}\right)_{\alpha} \\
& =\sum_{F k \in S} \sum_{F s \in S} \pi_{k} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F k F s}{ }^{(n)}\right)_{\alpha}
\end{aligned}
$$

By Fubinis theorem.
$\sum_{F k \in S}^{\text {Suppose }} \pi_{F k} \bigcup_{\alpha \in(0,1]} \alpha P_{F k F s}{ }^{(n)}<\pi_{F s}$
$\sum_{F k \in S}^{\text {Then }} \sum_{F s \in S} \pi_{k} \bigcup_{\alpha \in(0,1]} \alpha$
$\sum_{F k \in S} \pi_{F k}<\sum_{F s \in S} \pi_{F s}$
Which is a Contradiction.
Thus
$\sum_{F k \in S} \pi_{F k} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F k F s}{ }^{(n)}\right)_{\alpha}=\sum_{F k \in S} \pi_{F k} P_{F k F s}{ }^{(n)}$
$=\pi_{F s}$ for $n \geq 1$
In particular for $n \geq 1 \sum_{F s \in S} \pi_{F S} P_{F S F r}=\pi_{F r}$
This Proves (iii).
Moreover by Lebesgue Dominated convergence theorem and part(i) letting $n \rightarrow \infty$ in (4.3)

$$
\sum_{F s \in S} \pi_{F s} \pi_{F r}=\pi_{F r}
$$

Now $\pi_{F r}>0$ that gives

$$
\sum_{F s \in S} \pi_{F s}=1
$$

To show that the solution given by (ii) and (iii) is unique. Suppose that $\left\{\mathrm{x}_{\mathrm{Fr}}, \mathrm{Fr} \in \mathrm{S}\right\}$ is another such solution satisfying $\mathrm{x}_{\mathrm{Fr}}>0$
$\sum_{F s \in S} \pi_{F s}=1$
and
$x_{F r}=\sum_{F s \in S} x_{F s} P_{F s F r}$
$=\sum_{F s \in S} x_{F s} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F s F r}\right)_{\alpha}$
$=\sum_{F s \in S}\left(\sum_{F k \in S} \bigcup_{\alpha \in(0,1]} \alpha x_{F k}\left(P_{F k F s}\right)_{\alpha}\right)\left(P_{F s F r}\right)_{\alpha}$
$=\sum_{F s \in S} x_{F k}\left(\sum_{F k \in S} \bigcup_{\alpha \in(0,1]} \alpha\left(P_{F k F s}\right)_{\alpha}\left(P_{F s F r}\right)_{\alpha}\right)$
(By Fubinis theorem)
$=\sum_{F s \in S} x_{F k} P_{F k F r}{ }^{(2)}$
$=\sum_{F s \in S} x_{F k} P_{F k F r}{ }^{(n)}$
By the Lebesgue Dominated Convergence theorem, Letting $\mathrm{n} \rightarrow \infty$

$$
x_{F r}=\sum_{F k \in S} x_{F s} \pi_{F r}=\pi_{F r} \sum_{F k \in S} x_{F s}=\pi_{F r} \text { for all } F r \in S
$$

Thus the solution $\left\{\pi_{i} \quad i \in S\right\}$ is unique.

## THEOREM: 4.2

A Fuzzy Markov chain remains Markov if time is reversed.
$\mathrm{P}\left(\mathrm{X}_{\mathrm{n}}=\mathrm{F}_{\mathrm{rn}} \mid \mathrm{X}_{\mathrm{n}+1}=\mathrm{F}_{\mathrm{rn}+1} \ldots \ldots \ldots \ldots . \mathrm{X}_{\mathrm{n}+\mathrm{k}}=\mathrm{F}_{\mathrm{rn}+\mathrm{k}}\right)$
$=P\left(X_{n}=F_{r n} \mid X_{n+1}=F_{r n+1}\right)$
Proof:

$$
\begin{aligned}
& P\left(X_{n-1}=F r_{n-1} \mid X_{n}=F r_{n}, X_{n+1}=F r_{n+1} \ldots \ldots .\right) \\
& =\bigcup_{\alpha \in(0,1]} \alpha P\left(X_{n-1}=\left(F r_{n-1}\right)_{\alpha} \mid X_{n}=\left(F r_{n}\right)_{\alpha}, X_{n+1}=\left(F r_{n+1}\right)_{\alpha} \ldots \ldots\right) \\
& =\frac{\mathrm{U}_{\alpha \in(0,1]} \alpha P\left(X_{n-1}=F r_{n-1}, X_{n}=F r_{n}, X_{n+1}=F r_{n+1} \ldots \ldots\right)}{\mathrm{U}_{\alpha \in(0,1]} \alpha P\left(X_{n}=F r_{n}, X_{n+1}=F r_{n+1} \ldots \ldots\right)} \\
& =\frac{\begin{array}{c}
\mathrm{U}_{\alpha \in(0,1]}
\end{array} \begin{array}{c}
\alpha P\left(X_{n+1}=\left(F r_{n+1}\right)_{\alpha}, X_{n+2}=\left(F r_{n+2}\right)_{\alpha} \ldots \mid X_{n}=\left(F r_{n}\right)_{\alpha}, X_{n-1}=\left(F r_{n-1}\right)_{\alpha}\right) \\
. \bigcup_{\alpha \in(0,1]} \alpha P\left(X_{n}=\left(F r_{n}\right)_{\alpha}, X_{n-1}=\left(F r_{n-1}\right)_{\alpha}\right)
\end{array}}{\mathrm{U}_{\alpha \in(0,1]} \alpha P\left(X_{n+1}=\left(F r_{n+1}\right)_{\alpha}, X_{n+2}=\left(F r_{n+2}\right)_{\alpha} \ldots \mid X_{n}=\left(F r_{n}\right)_{\alpha}\right)} \\
& \text {. } \mathrm{U}_{\alpha \in(0,1]} \alpha P\left(X_{n}=\left(F r_{n}\right)_{\alpha}\right) \\
& =\bigcup_{\alpha \in(0,1]} \alpha P\left(X_{n-1}=\left(F r_{n-1}\right)_{\alpha} \mid X_{n}=\left(F r_{n}\right)_{\alpha}\right) \\
& =P\left(X_{n-1}=\left(F r_{n-1}\right) \mid X_{n}=\left(F r_{n}\right)\right)
\end{aligned}
$$

## THEOREM: 4.3

In a Fuzzy Markov chain if the present is specified then the past is independent of the future in the following sense.
$P\left(X_{n}=F r_{n} X_{F k}=F r_{k} \mid X_{m}=F r_{m}\right)=P\left(X_{n}=(F r)_{n} \mid X_{m}=(F r)_{m}\right) P\left(X_{k}=(F r)_{k} \mid X_{m}=(F r)_{m}\right)$
Proof:
By the Chain rule of conditional probabilities

$$
\begin{aligned}
& P\left(X_{n}=F r_{n} X_{F k}=F r_{k} \mid X_{m}=F r_{m}\right) \\
